From obs: " Remotely triggered from tracks visible on right side of photo. This photo shows one of five similar remotely triggered avalanches today... All five avalanches released from 35-40 degree rollovers at the interface beneath ~20cm of new snow and were all size D1. The five avalanches spanned from 8500-9500 feet elevation on SE, S, SW, and NW aspects. No activity (e.g. wumphing, cracking, avalanches) was observed below the new-old snow interface." Photo: J. Taylor
