Skier triggered on Emigrant Peak

Emigrant Peak Out of Advisory Area 12/24/2018 Code HS-ASu-R3-D3-O Elevation 9800 Aspect N

Latitude

45.26290

Longitude

-110.70700

Notes

From an email:

This was triggered Christmas Eve day while skinning up a ridge in the mountains east of Emigrant Peak. It broke about 8' back from the cornice/drift right near my ski tips. I instinctively did a quick drop and roll away even though it was unnecessary. Pretty pulse quickening. I didn't get great pictures as I was heading up the ridge and the light was bad. You can pick out the debris flow by its lighter shade of white and see chunks of cornice/slab that got hung up in the starting zone.

North Facing aspect at approx. 9800' on a west to east ridge. Slope angles are 35-40. Crown varied from 1-3'. Hard slab on the the cornice propagated to two other small starting zones and pulled the cornices and all the faceted snow near the ridgeline. Avalanche ran about 800'.

The last few week's weather has really weakened what was starting off to be a decent base. Now the winds have capped a a lot of zones with a hard slab pockets.

Number of slides

Number caught

Number buried

Avalanche Type

Hard slab avalanche

Trigger

Skier

Trigger Modifier

u-An unintentional release

R size

3

D size

Bed Surface

O - Old snow

Problem Type

Persistent Weak Layer

Slab Thickness

100.0 centimeters

Vertical Fall

800ft

Slab Width

100.00ft
