

Small Wind Slab Triggered at Lewis and Clark

Date

Tue, 02/04/2025 - 14:35

Activity

Skiing

While skiing at Lewis and Clark yesterday, I triggered a small wind slab (roughly 2ft rectangle) while traversing into the run with no propagation. While we skied the run, there was some pretty heavy sluffing. Much of the surface was wind-affected, with a dense top layer that broke through to a weaker, less dense layer.

Region

Bridger Range

Location (from list)

Bridger Bowl Weather Station - The Ridge
